Retrospective Test of Trend Projections for Loss Ratios

Attached is a retrospective test of the predictive accuracy of various trend procedures.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points, which permitted a test of the projected loss ratio three years hence, were used. Our current review trends policy year 2003 3.25 years, policy year 2002 4.25 years, and policy year 2001 5.25 years. An average of those three values is then calculated.

Current estimates of policy year ultimate loss (to expected loss) ratios are compared with predicted values based on trending through earlier years. The results are available for each of twenty-one loss development approaches - incurred and paid-to-2nd through paid-to-20th, as well as the average of the incurred and paid-to-20<sup>th</sup> methods, although only eleven approaches are shown.

As an illustration, the incurred loss development approach generated an indemnity loss ratio of 0.4594 for policy year 1999. Fitting the loss ratios for policy years 1993 to 1996 using a straight line and projecting that to 1999 yielded a loss ratio of 0.2472, which understates our current estimate for 1999 by 0.2122 points.

Please note that the boxed numbers correspond to those numbers that do not have a comparable value in Exhibit 11b, Retrospective Test of Trend Projections for Severity Ratios.
